To Section V:

1. Claim 1 meets the requirements of Article 33(2) and (3) PCT for the following reasons:

It is known that the quality of speech recognition at the receiving side of a mobile communication network is insufficient since the recognition result of a received and decoded speech signal may be affected by noise and transmission errors on the radio path. To solve the technical problem, the inventors suggest, at the receiving side, to provide a control parameter relating to information on characteristics of the signal received to a speech-recognition system. Accordingly, the operation of the speech-recognition means is affected by one or more control parameters entered by way of a control input, each control parameter relating to a specific characteristic of the signal entered from the source to the speech-recognition means. The subject-matter of claim 1 is novel. Since the subject-matter of claim 1 is non-obvious to a skilled person, claim 1 involves an inventive step.

Document D1= EP-A-0854622 is a relevant prior art which discloses a mobile communication apparatus comprising a speech codec and a speech processor. However, the function of said speech processor is merely to suppress erroneous speech data in a frame to improve tone quality.

1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

ignored or adjusted, e.g., partially processed. Apart from the parameters referred to above - the BFI and the SID - use is also made of an encoding-mode parameter defining the significance of the speech-frame bits (FR [= Frame Relay], EFR [= Enhanced Full Rate], or the various modes under which AMR [= Adaptive Multi Rate] may operate). On the basis hereof, the recognition algorithm operative in the speech recogniser is adjusted to the characteristics with which the speech signal is encoded and decoded.

It is noted that control of speech processing means by error parameters are known from EP0854622. The known system, however, aims at improving the tone quality in voice transmission and reproduction, while the present invention refers to the field of speech-recognition, which means conversion from speech (spoken words) to text (printable characters).

DESCRIPTION OF THE FIGURES

The operation of the invention is further explained with reference to several figures. As an example, we take the current part of the GSM system which makes use of an Enhanced Full Rate (= EFR) codec[?]. The same does not apply, however, to a Full Rate (= FR) codec, nor to the (future) Adaptive Multi Rate (= AMR) codec. FIG. 1 shows two terminals - a first, mobile terminal, such as a GSM handset, and a second, nonmobile terminal, such as a GSM base station - which are capable of communicating with one another by way of a wireless medium 9. In the figure, there is presented only upstream communication - from handset to base station.

The handset shown in the top part of FIG. 1 comprises two modules or subsystems, namely a TX/DTX Handler 1 (DTX stands for Discontinuous Transmission) and a TX Radio Subsystem 2. Module 1 comprises a microphone 3, a speech encoder 4 and a Voice Activity Detector (= VAD) 5. Module 2 comprises a channel encoder 6, a Speech-flag monitor 7 and a transmitter 8. Signals received by the microphone 3 are fed to both the speech encoder 4 and to the VAD 5.

In the VAD 5, it is detected whether the microphone 3 is receiving speech or silence. This is encoded with a "Speech flag" (=SF), which is sent along with each speech frame. In the channel encoder 6, the microphone signal encoded in encoder 4 is

ignored or adjusted, e.g., partially processed. Apart from the parameters referred to above -- the BFI and the SID -- use is also made of an encoding-mode parameter defining the significance of the speech-frame bits (FR [= Frame Relay], EFR [= Enhanced Full Rate], or the various modes under which AMR [= Adaptive Multi Rate] may operate). On the basis hereof, the recognition algorithm operative in the speech recogniser is adjusted to the characteristics with which the speech signal is encoded and decoded.

DESCRIPTION OF THE FIGURES

The operation of the invention is further explained with reference to several figures. As an example, we take the current part of the GSM system which makes use of an Enhanced Full Rate (= EFR) codec[?]. The same does not apply, however, to a Full Rate (= FR) codec, nor to the (future) Adaptive Multi Rate (= AMR) codec. FIG. 1 shows two terminals -- a first, mobile terminal, such as a GSM handset, and a second, nonmobile terminal, such as a GSM base station -- which are capable of communicating with one another by way of a wireless medium 9. In the figure, there is presented only upstream communication -- from handset to base station.

The handset shown in the top part of FIG. 1 comprises two modules or subsystems, namely a TX/DTX Handler 1 (DTX stands for Discontinuous Transmission) and a TX Radio Subsystem 2. Module 1 comprises a microphone 3, a speech encoder 4 and a Voice Activity Detector (= VAD) 5. Module 2 comprises a channel encoder 6, a Speech-flag monitor 7 and a transmitter 8. Signals received by the microphone 3 are fed to both the speech encoder 4 and to the VAD 5.

In the VAD 5, it is detected whether the microphone 3 is receiving speech or silence. This is encoded with a "Speech flag" (=SP), which is sent along with each speech frame. In the channel encoder 6, the microphone signal encoded in encoder 4 is encoded into frames capable of being transmitted by way of transmitter 8. To the frames, there is added redundant information, such as a check-sum code (CRC) on the basis whereof it may be calculated, at the receiving side, whether the frame has been transmitted correctly. In specific cases, an
